

Detox Cleansing Deodorant™

Test Notes

Introduction

Until recently, the axillary gland (underarm) has been overlooked by scientists and doctors in their research and studies. Recent discoveries have brought new light to this area of the body. Herbalix Restoratives has developed **Detox Cleansing Deodorant** to help flush aluminum from the axillary gland and return it to a balanced state.

HR privately funded a clinical test to establish the effectiveness of its Detox Deodorant against a leading antiperspirant. There were four stages of the test.

Inorganic Test

Determine the amount of aluminum present in both the antiperspirant and the Detox Cleansing Deodorant. Test results show the antiperspirant had extreme amounts of aluminum and the Detox Cleansing Deodorant had none.

One Week without antiperspirants or deodorant

Determine if any aluminum values existed at the onset of the test (baseline). Test results show the aluminum baseline value of the subjects had elevated levels from 42 to 161 ug/g.

One week with antiperspirant only

Determine if aluminums are absorbed by the axillary glands while using antiperspirants. Results – the aluminum values were not only elevated but also indicated variances in left and right arms.

One week with Detox Cleansing Deodorant only

Determine if Detox Cleansing Deodorant can reduce the levels of aluminum in the axillary gland. Result – not only was Detox Deodorant able to safely cleanse the axillary gland for every subject in the test, it was able to restore the left and right underarms to a normal balance (cascading of aluminums).

Analysis

All subjects revealed excessive aluminum levels as well as asymmetrical values. The source of these aluminums is both environmental (air, water, agriculture) as well as absorbed (food, antiperspirants, body care products). Aluminums are ubiquitous in the environment. Aluminum is a soft metal which has no benefit to the body and which disrupts signals from the cells, changes the shape/function of red blood cells, and hides in the fatty tissue. The use of antiperspirants allows aluminums to be absorbed into the axillary gland and also prevents stored aluminums from cascading out.

Evaluation

With the use of Detox Cleansing Deodorant, it is possible to reduce the level of aluminums which are stored in the axillary gland. Herbalix Restoratives has been able to determine a benchmark value for the lymphatic recovery zone. This information is further being analyzed and evaluated by scientists around the world who are curious about our results and its possibilities. This is the first time that a product has been able to equalize the cascading of both axillaries since they were first studied in 1922 by a German scientist.

In our estimation, topical application of Detox Cleansing Deodorant, a product without synthetic chemicals or petroleum, can be safely used. It is our intention to conduct further testing on Detox Cleansing Deodorant, to record its ability to remove other impurities. The research and results will be compiled in the publication of a scientific report, in the very near future.
